Installation and Flue design

A chimney or flue design is one of the most important aspects in getting your stove to combust and burn efficiently. Poorly designed or badly installed flues can result in a downdraft or poor burning which results in blackening.

Using only the best quality materials and flue systems from established suppliers we supply all flues from swept bends to adjustable section trim plates and wall supports. We recommend a vitreous flue, manufactured in the UK using 1.2mm enamelled steel or to have your chimney relined using high quality triple skin 316 or 904 liners. We can also supply twin wall flue in stainless or black, and can also specify RAL colour for specific projects.

Even if you don't have a chimney, we can design your flue and supply visuals. Gas stoves can be located in an area with no chimney and work very efficiently using a balanced flue.

Visit our showroom to discuss all aspects of flue design and installation.

Nationwide Installation

Our experienced fitters are trained with HETAS (solid fuel) and RGI (gas), keeping up-to-date with latest codes of practice to ensure your stove or fire is safely installed.

Fuel your Fire

Fuel is of the upmost importance. Wet fuel will result in creosote build up and dirty glass making the fire inefficient and could end up damaging your stove. Visit woodireland.com for premium quality fuel.
